P21: published CM states and an independent CytoSPACE parameter comparison

Top: authors' published final labels, verified against original barcodes, centroids and transcript totals. These are not newly inferred identities.
Bottom left: our independent snRNA reference, raw counts, default seed/downsampling and 10,000-cell partitions; no ventricular subtype labels supplied.
The two annotation systems differ. v.CM is one working-ventricular state; p.CM includes chamber-unresolved cycling CMs.
Kcnd2 and Irx5 are unassayed; TF_Irx5 is a derived feature. Positions and measured counts are unchanged.
