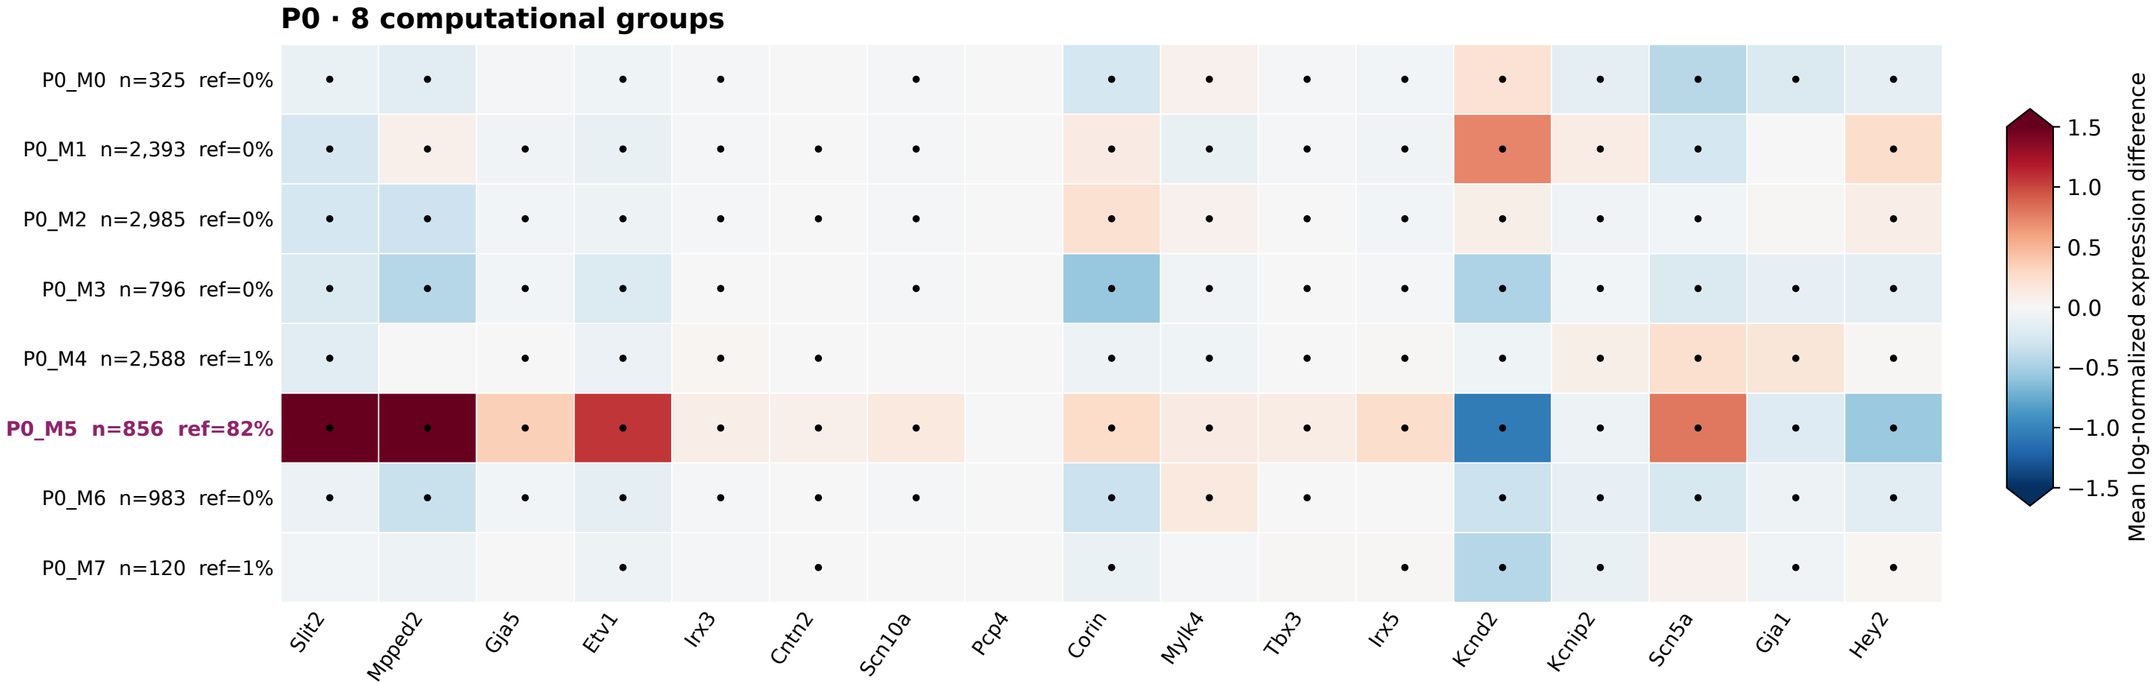
P0: electrical and regional-associated gene contrasts



Color: equal-library mean cluster-minus-other-CMs difference in mean log1p(counts / total × 10,000), clipped to ±1.5; not log2 fold change.
Gray: fewer than two eligible libraries or missing contrast. A library requires ≥30 cluster nuclei and ≥30 other CMs from the same stage.
Black dot: same corrected-count effect direction in both libraries, with raw-count direction concordance; not a significance test.
ref = ambiguous Slit2-overlap reference fraction; purple labels mark ≥50% reference cells. Slit2/Mpped2/Gja5/Etv1 partly overlap selection panels, not independent validation.
Gene patterns do not verify wall location, mechanical load, oxygen exposure or Purkinje identity. Comparisons are within each stage.
