Ventricular-like cardiomyocytes: sample/batch sensitivity

P0 P7 P14 P21

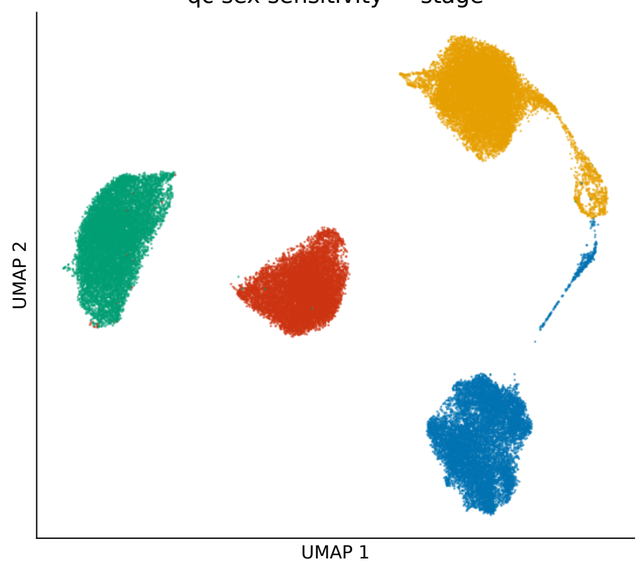

uncorrected — stage

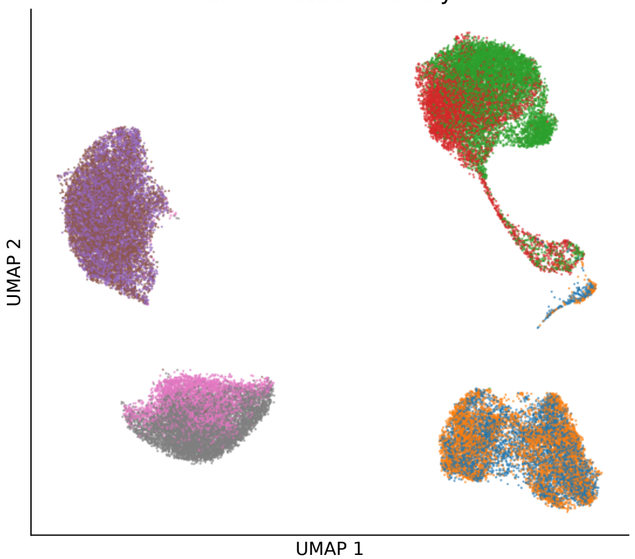

within stage harmony — stage

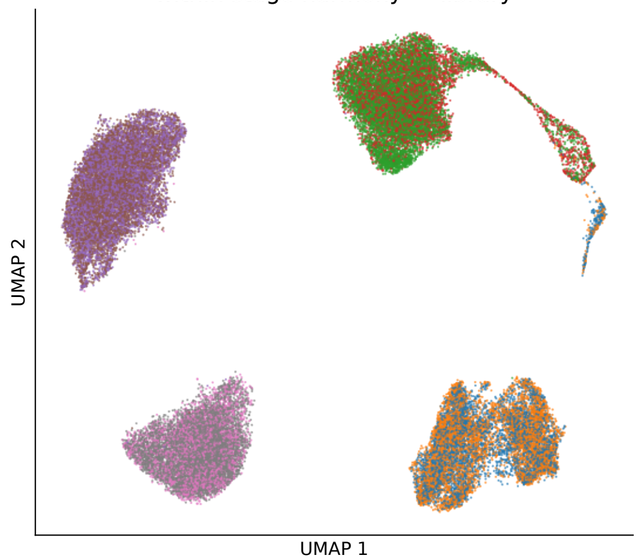

qc sex sensitivity — stage

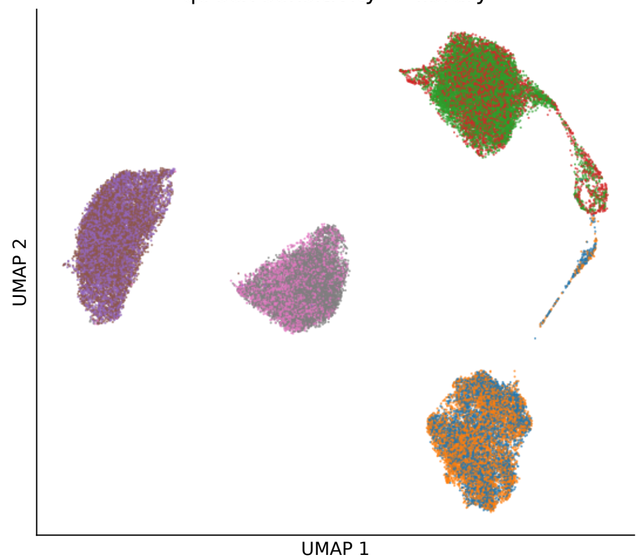

uncorrected — library

within stage harmony — library

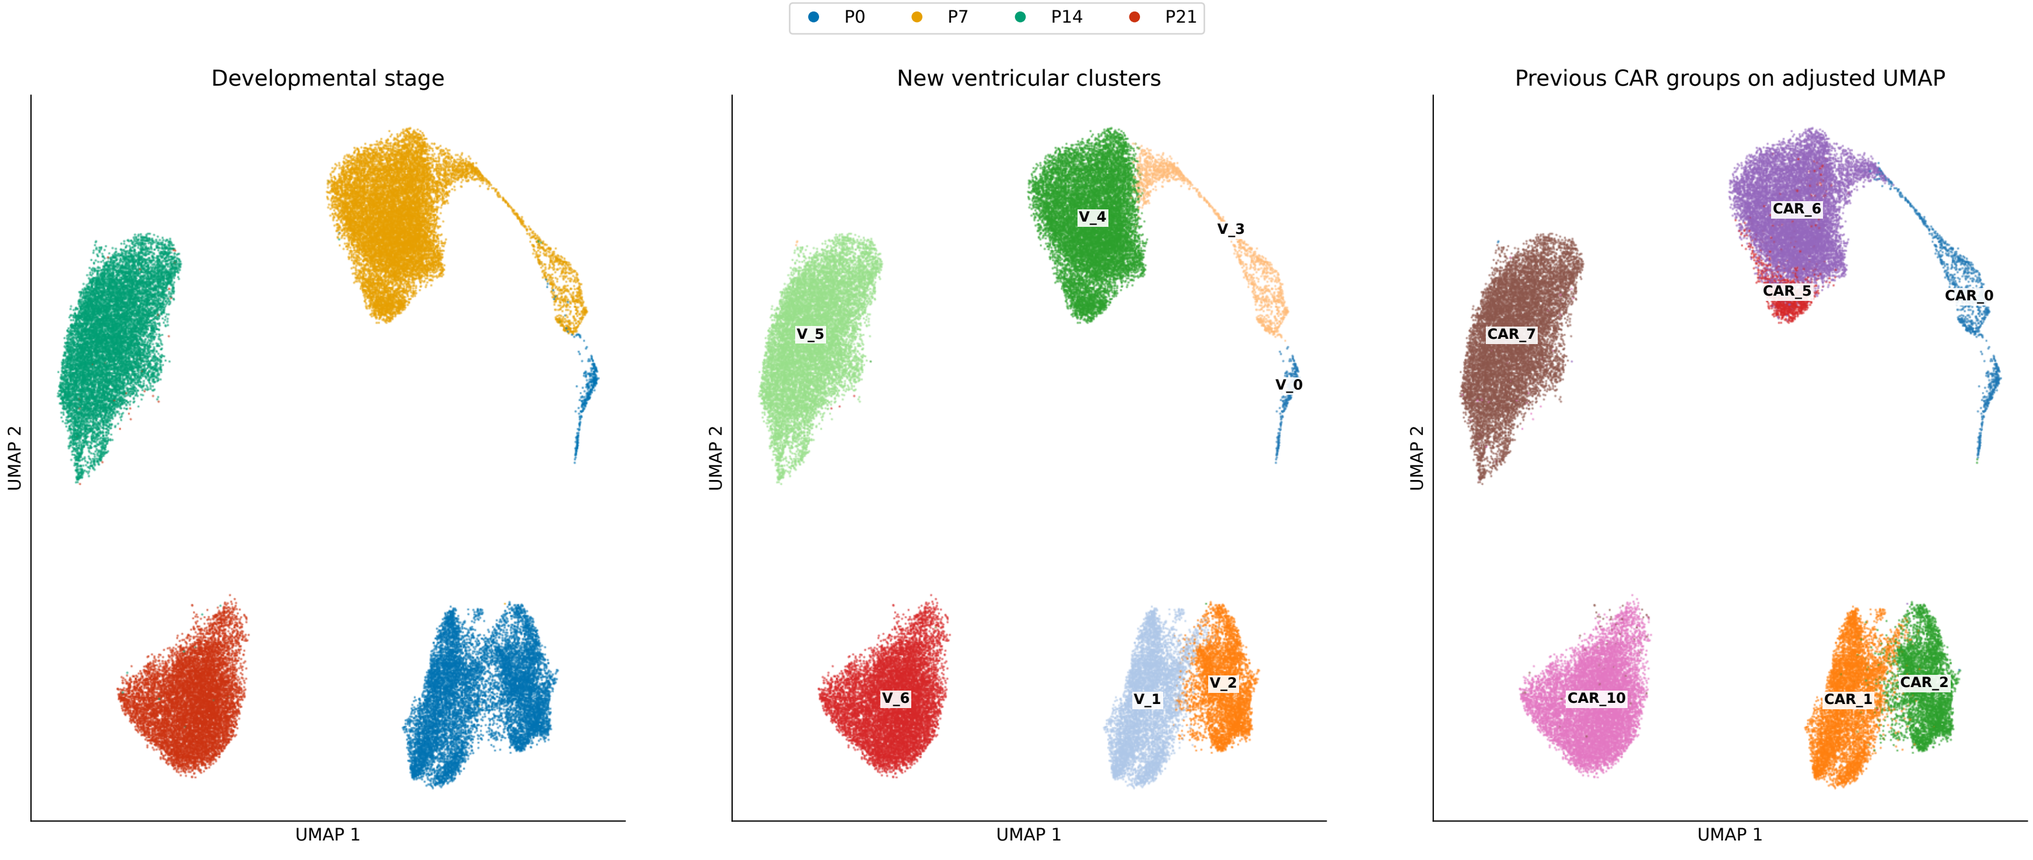

qc sex sensitivity — library

43,249 nuclei · Harmony adjusts libraries within each stage; ages are not aligned. QC/sex regression is sensitivity only.
Each column has a separately fitted UMAP; positions and distances cannot be compared between columns.

Ventricular-like cardiomyocytes — within-stage sample-adjusted UMAP

Same adjusted coordinates in all three panels · New V IDs are computational clusters; previous CAR IDs are retained as reference.
Expression/count matrices unchanged. Stage-specific batch effects remain inseparable from age.

Ventricular clusters across stages — same sample-adjusted UMAP

Color: new ventricular cluster · Gray: other stages · Common coordinates and axes across panels
No forced mixing between stages; stage differences include biology and potentially stage-confounded technical effects.
