P14: pushing ventricular spatial mapping to 5 existing RNA groups

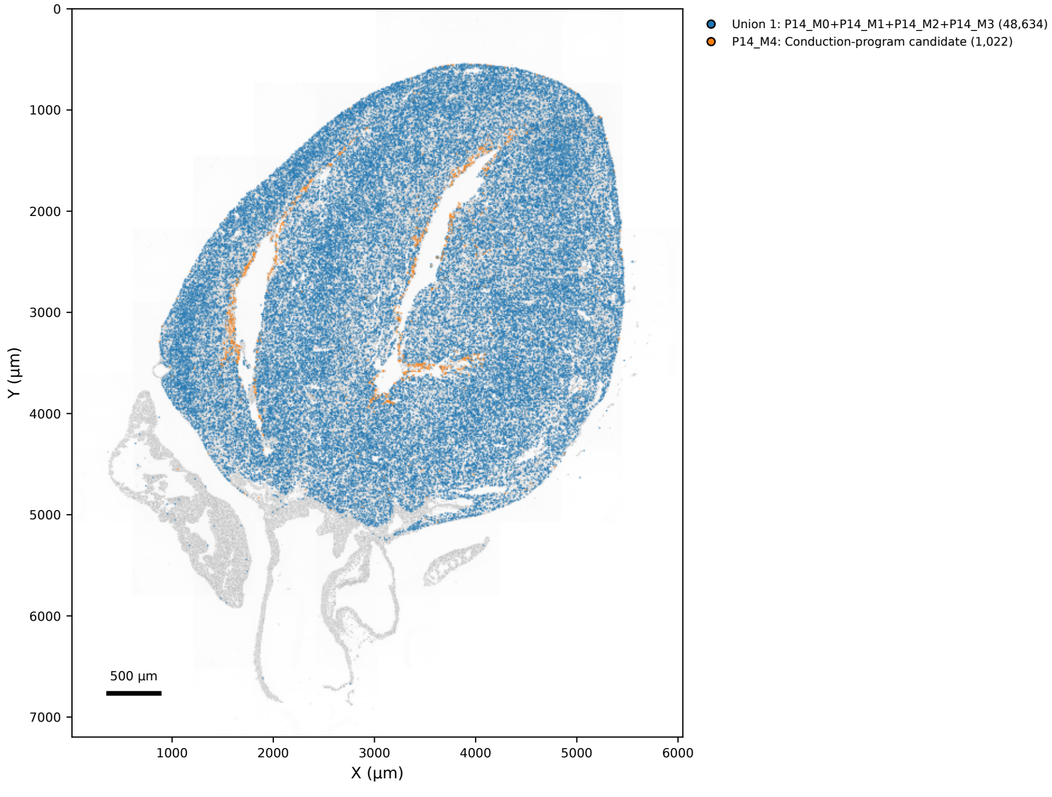

Finest exploratory proposals: every existing RNA group

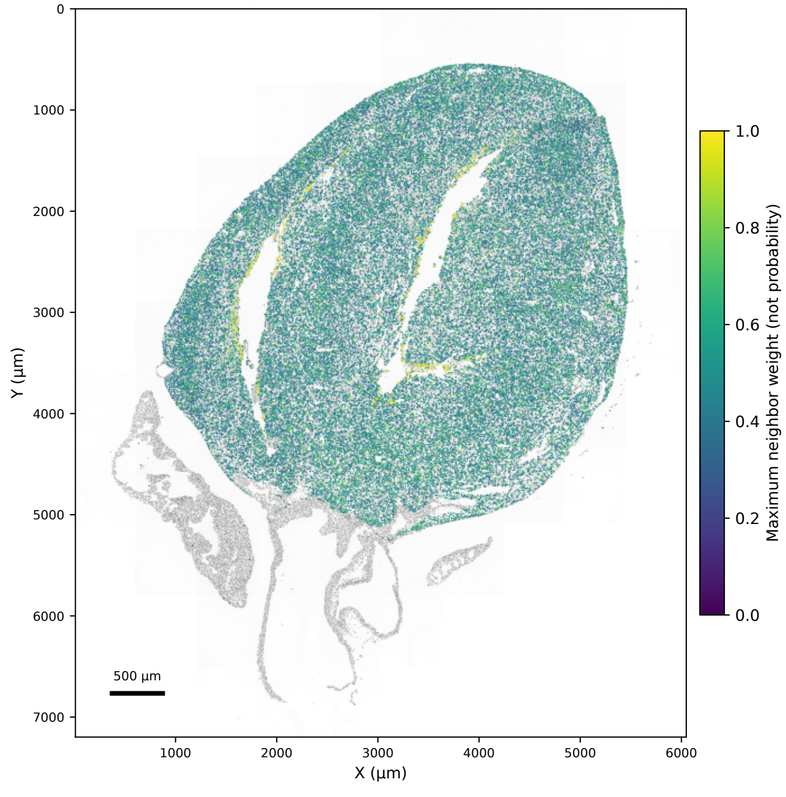

Fine candidates with either internal support check

Coarser cut selected on reserved RNA validation nuclei

Fine-label weight concentration, without smoothing

Top left is a permissive hypothesis map; top right adds internal RNA support, library/raw consistency and measured-marker co-detection.
The merged unions are computational resolution checks, not newly discovered biological cell types. No coordinates are moved or labels spatially smoothed.
Conduction labels remain candidates. Kcnd2/Irx5 are unassayed; all working/electrical labels originate from the RNA reference.
