Muscle development and matrix composition change on different schedules

a Independent roles of the assays

snRNA-seq · 2 libraries per age

All subunits expressed in both libraries;
CM receptors and source identity

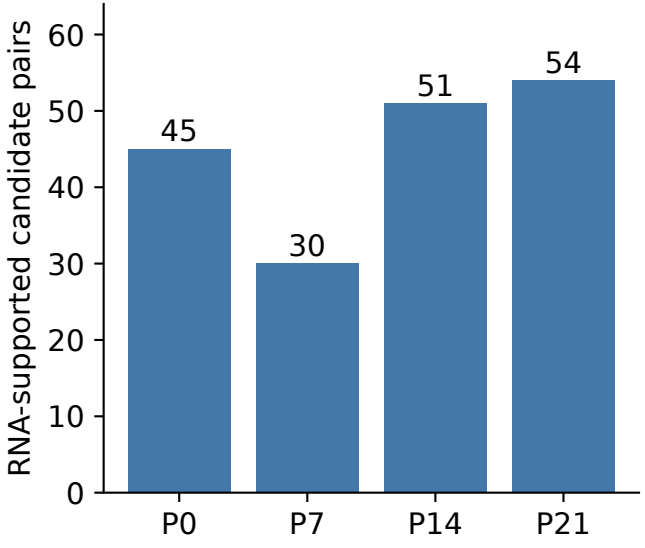

Xenium · observed RNA and locations

Local source expression, CM receptors,
21-gene and component outcomes

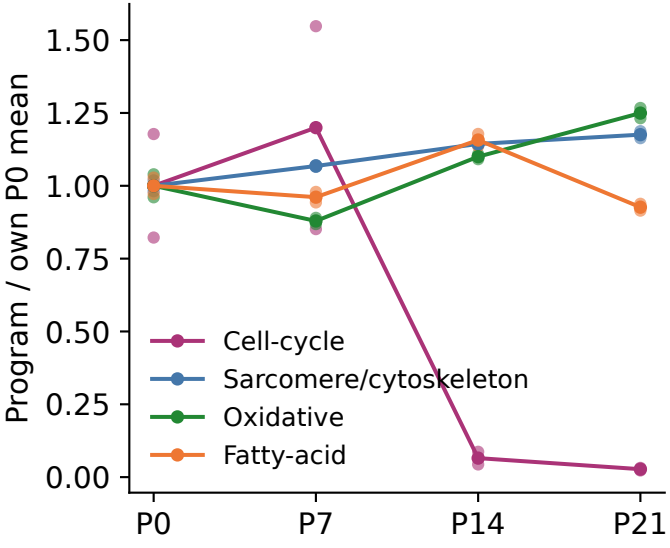

Four buffered test domains

No shared source cells across folds;
≥400 µm between training and test CMs

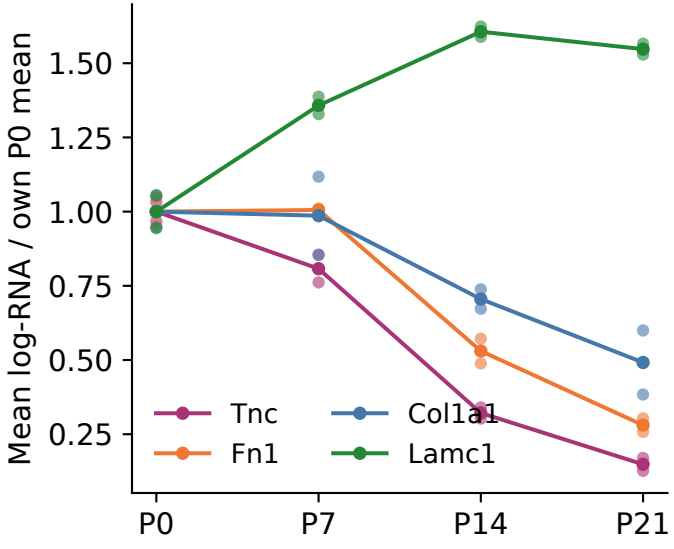

b RNA-supported candidate pairs

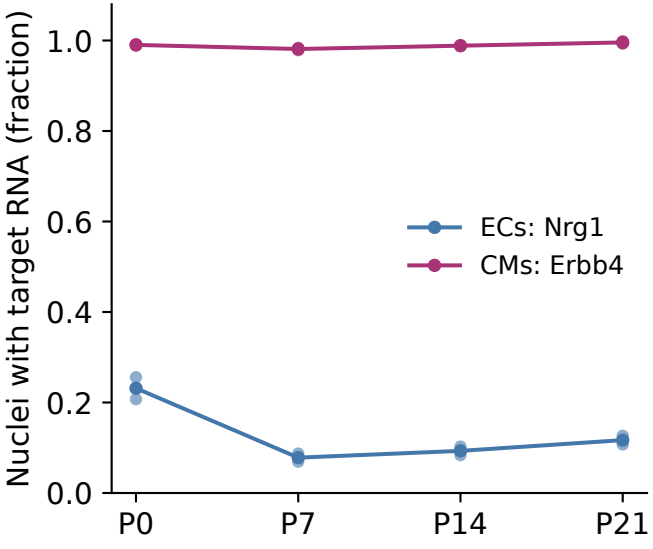

c CM programs change differently

d Fibroblast matrix expression changes

e A vascular candidate has CM support

f P7 · buffered domains
